ForeSite[®] Edge

Boosts Production 6%, Reduces Wellsite Visits 70%, Reduces Failures 15%, Increases Revenue \$200K per Year

Objectives

- Install autonomous control capability and increase production through continuous optimization in three reciprocating-rod-lift wells. Two wells are equipped with non-Weatherford variable speed drives (VSDs) and one is equipped with a conventional rod-pump controller (RPOC).
- Improve uptime in each well. They are prone to failure and can only be detected by visual inspection.
- Increase personnel efficiency by enabling remote data monitoring, reducing wellsite visits, and supporting remote well management.
- Leverage existing VSD and RPOC automation investments.

Our Approach

- A Weatherford team consisting of production software experts and engineers conducted an optimization analysis. To enhance well visibility and data availability, the team recommended ForeSite Edge—a nextgeneration controller that leverages high-frequency data and modelling at the wellsite—to be installed alongside each well's existing automation and in addition to the client's enterprise-level ForeSite platform solution.
- Deployed to the field, ForeSite Edge enabled remote monitoring for key performance measurements such as strokes per minute (SPM), pump fillage, effective runtime, strokes per day, and more. This data led to optimization opportunities in each well.
- In the VSD-operated wells, autonomous control leveraged high frequency data to optimize the VFD Min/Max frequency while maintaining the target pump fillage. ForeSite Edge then increased production by accelerating speed by step changes. In the RPOC-operated well, autonomous control logic applied toward idle-time optimization to manage pump fillage.

Value to Customer

- ForeSite Edge delivered autonomous control to three rod-lift wells. Highfrequency data enabled production-uplift recommendations that increased production by 6% or nearly \$150,000 per year.
- Remote management capabilities reduced failures by 15%, or 1.5 pump failures per year that cost \$25,000 per failure.
- Autonomous control enhanced personnel efficiency and reduced wellsite visits by 70%, which saved \$36,000 per year.
- The ForeSite Edge solution leveraged the existing VSD and RPOC from a competing service company, which minimized CAPEX spend.

ForeSite Edge leveraged existing automation equipment to deliver autonomous control, which increased incremental revenue by \$200,000 per year in three rod-lift wells.

LOCATION Illinois, USA

ARTIFICIAL LIFT TYPE Reciprocating rod lift

TOTAL WELLS 3

EXISTING AUTOMATION 2 VSDs and 1 RPOC

AVERAGE FAILURE RATE 1.5 per well per year

AVERAGE DEPTH 11,500 ft (3,505 m)

PRODUCTS/SERVICES

- ForeSite Edge
- Production optimization consulting
