Uniset ABD Equalizing Prong

The Uniset ABD Equalizing Prong is used when retrieving ABC Tubing Hanger Plugs. Made up beneath the QXT Pulling Probe, the ABD Equalizing Prong pushes the equalizing feature of the ABD (Anti-Blowout Device) off seat. If a pressure differential is present below the ABC Tubing Hanger Plug the pressure-sensing piston of the ABD will be activated and the pressure sensing keys will be pushed into the bore of the ABD. These keys will then allow sufficient access for the ABD Equalizing Prong to open the ABD equalizing feature, but will not allow the QX Pulling Probe to depress the inner mandrel of the QXT lock.

Once the QXT Tubing Hanger Plug is equalized the ABD pressure sensing piston moves down allowing the pressure sensing keys to retract from the ABD bore. It is now possible for the ABD Equalizing Prong to fully enter the ABD. This then allows the QXT Pulling Probe to depress the inner mandrel of the QXT lock and the fishing neck of the lock to be latched. This safety feature ensures that the QXT lock cannot be released and latched with a pressure differential from below present.

Specification Guide

Seal Bore	Lock Mandrel Assembly No.	ABD Assembly No.	Equalizing Prong Assy/Part No.	Upper Thread Connection
