

S Running Tool

Weatherford's S running tool is a static (non-rotating) liner running tool that enables deployment of a liner or tie-back packer. The S running tool features a left-hand float nut that supports the weight of a liner as it runs the liner to the setting depth. The S running tool is easily released with right-hand rotation at the tool.

Applications

- Liners that do not require rotation to reach bottom or after the the hanger is set
- Liner tie-back packers

Features, Advantages and Benefits

- The tool is mechanically released from the liner with right-hand rotation at the tool.
- Using the same float nut as the R running tool, the S running tool can be used in conjunction with any liner setting sleeve or liner-top packer with R running tool profile.

Options

The top sub can be removed to make the S running tool directly compatible with Weatherford's PBR packoff, making this tool an ideal choice for running a bottom-set tie-back packer.
