ISO Extreme Retrievable Well Barrier

Creates a V0-rated barrier that isolates the wellbore without the need for a nipple profile

Applications
- Packer setting and completion installation
- Contingent plugging of completions with damaged nipples
- Temporary zonal isolation and plugging
- Hanging of completion accessories within the tubing string
- Temporary well suspension
- Pressure testing of production tubing and packer setting
- Wellhead repair and replacement

Features and Benefits
- The ISO Extreme retrievable well barrier meets ISO 14310 V0 standards for high-performance reliability.
- The 10,000-psi (69-MPa) pressure rating provides high-integrity sealing to minimize loss-of-containment risk and associated health, safety, and environmental risks.
- Retrieval is achieved using an internal sleeve that is shifted down to equalize the pressure and then sheared up to release, minimizing the risk of the plug releasing before equalization.
- An internal and external fish neck provides options for removal.
- The short maximum running OD enables passage through wellbore restrictions.
- The tool enhances operational flexibility by enabling deployment on industry-standard-setting tools on any conveyance means.
- The element booster system traps boost pressure into the elements for higher-pressure and -temperature applications.
- Rotational locking during milling operations facilitates removal if it is not possible to retrieve the plug conventionally.
- Optimized slip and casing contact minimizes potential damage to tubing.
- Through the ports, the flow area exceeds the ID area to mitigate the risk of debris plugging the well barrier in overbalanced situations.
- The plug releases with as little as 3,000 lb (1,361 kg) to allow for the use of slickline for retrieval.
- The plugs are compatible with existing standard and trip-saver junk catchers to minimize inventory requirements.
- Body lock rings in the slip system prevent re-engagement of the slips after release.
Tool Description
The Weatherford ISO Extreme retrievable well barriers are set on electric line, slickline, tubing, or coiled tubing (CT) to temporarily isolate the well. The high-performance HNBR packing element provides a V0-rated seal that holds pressure from above and below while protecting the bidirectional, low-stress slip system from debris contamination. The plug is easily retrieved on tubing, CT, or slickline with a standard GS retrieval tool. An external fish neck serves as an alternative retrieval method. Once the retrieval tool engages the top of the plug, jarring down will shear an equalizing valve that locks in the open position. Straight pull releases the plug, and a release-retention system maintains run-in diameter of the plug for easy removal from the wellbore.
